26. Two very long, straight, and insulated wires are kept at  $90^\circ$  angle from each other in xy-plane as shown in the figure. These wires carry currents of equal magnitude  $I$ , whose directions are shown in the figure. The net magnetic field at point P will be :

- (1)  $\frac{\mu_0 I}{2\pi d} (\hat{x} + \hat{y})$       (2) zero      (3)  $\frac{+\mu_0 I}{\pi d} (\hat{z})$       (4)  $-\frac{\mu_0 I}{2\pi d} (\hat{x} + \hat{y})$

Sol. 2

$$B_1 = \frac{\mu_0}{2\pi d} (-\hat{k})$$

$$B_2 = \frac{\mu_0}{2\pi d} (\hat{k})$$

$$B = 0$$

27. In a simple pendulum experiment for determination of acceleration due to gravity ( $g$ ), time taken for 20 oscillations is measured by using a watch of 1 second least count. The mean value of time taken comes out to be 30 s. The length of pendulum is measured by using a meter scale of least count 1 mm and the value obtained is 55.0 cm. The percentage error in the determination of  $g$  is close to -  
 (1) 0.2 %                      (2) 6.8 %                      (3) 0.7 %                      (4) 3.5 %

Sol. 2

$$T = 2\pi\sqrt{\frac{l}{g}}$$

$$T^2 = 4\pi^2 \frac{l}{g}$$

$$g = \frac{4\pi^2 l}{T^2}$$

$$\frac{dg}{g} = \frac{dl}{l} - \frac{2dT}{T}$$

$$\text{error} \Rightarrow \frac{dg}{g} = \frac{dl}{l} + 2 \left( \frac{dT}{T} \right)$$

$$= \left( \frac{0.1}{55} + 2 \times \frac{1}{30} \right) \times 100 = \frac{226}{33} = 6.84\%$$

28. A common emitter amplifier circuit, built using an npn transistor, is shown in the figure. Its dc current gain is 250,  $R_C = 1 \text{ k}\Omega$  and  $V_{CC} = 10 \text{ V}$ . What is the minimum base current for  $V_{CE}$  to reach saturation ?

- Sol. 4  
 (1) 7  $\mu\text{A}$                       (2) 10  $\mu\text{A}$                       (3) 100  $\mu\text{A}$                       (4) 40  $\mu\text{A}$

$$\begin{aligned} B &= 50 \\ R_C &= 1 \text{ k}\Omega \\ V_{CC} &= 10 \text{ V} \\ i_B &= ? \end{aligned}$$

$$\beta = 250 = \frac{I_C}{I_B} \quad \dots(1)$$

$$I_B = \frac{I_C}{250}$$

$$\text{for saturation current } V_{CC} = I_C R_C \quad \dots(2)$$

$$I_C = \frac{10}{10^3} = 10^{-2} \text{ A}$$

$$= \frac{10^{-2}}{25 \times 10}$$

$$= 40 \mu\text{A}$$

- 29.** Two magnetic dipoles X and Y are placed at a separation  $d$ , with their axes perpendicular to each other. The dipole moment of Y is twice that of X. A particle of charge  $q$  is passing through their midpoint P, at angle  $\theta = 45^\circ$  with the horizontal line, as shown in figure. What would be the magnitude of force on the particle at that instant? ( $d$  is much larger than the dimensions of the dipole)

- (1)  $\left(\frac{\mu_0}{4\pi}\right) \frac{M}{\left(\frac{d}{2}\right)^3} \times qv$  (2) 0 (3)  $\sqrt{2} \left(\frac{\mu_0}{4\pi}\right) \frac{M}{\left(\frac{d}{2}\right)^3} \times qv$  (4)  $\left(\frac{\mu_0}{4\pi}\right) \frac{2M}{\left(\frac{d}{2}\right)^3} \times qv$

**Sol. 2**

Due to X

$$B_1 = 2 \left(\frac{\mu_0}{4\pi}\right) \frac{m}{\left(\frac{d}{2}\right)^3}$$

Due to Y

$$B_2 = \frac{\mu_0}{4\pi} \frac{(2M)}{\left(\frac{d}{2}\right)^3}$$

$$B_1 = B_2$$

$$B_{\text{net}} = B\sqrt{2}$$

at  $45^\circ$  Angle

Motion of charge is along the direction  $B_{\text{net}}$  Hence it will not Exp. no force.

- 30.** A solid sphere and solid cylinder of identical radii approach an incline with the same linear velocity (see figure). Both roll without slipping all throughout. The two climb maximum heights

$h_{\text{sph}}$  and  $h_{\text{cyl}}$  on the incline. The ratio  $\frac{h_{\text{sph}}}{h_{\text{cyl}}}$  is given by :

- (1)  $\frac{2}{\sqrt{5}}$  (2)  $\frac{14}{15}$  (3) 1 (4)  $\frac{4}{5}$

**Sol. 2**

From energy conservation

KE = P.E.

$$\frac{1}{2} I_{AOR} \omega^2 = Mgh_{cm}$$

For solid Sphere

$$\frac{1}{2} \left( \frac{1}{2} + 1 \right) mR^2 \omega^2 = mgh_{cm} \quad \dots(1)$$

For cylinder

$$\frac{1}{2} \left( \frac{1}{2} + 1 \right) mR^2 \omega^2 = mgh \text{ (cylinder)}$$

(1)/(2)

$$\therefore \frac{hs}{hc} = \left( \frac{14}{15} \right)$$
